MEDIA SEARCH ENGINE FOR A PERSONAL MEDIA NETWORK

ABSTRACT OF THE DISCLOSURE

[88] A system providing search functionality supporting the exchange and consumption of media is disclosed. The searching of media on storage belonging to any of a pre-defined group of users of a personal media network is provided. In addition, media stored on designated servers may also be included in a search. The media stored may include audio, still images, video, and data. A user may search the stored media using a number of criteria including the time period of the media, the type of device, and the type of media. The system also provides support for the search of one or more media peripherals, which may be searched when the media peripherals are communicatively coupled to the system.
